Vibration may be transmitted to the human body through the part in contact with the vibrating surface: the handle of a machine, the surface of a piece of equipment, or the seat of a mobile machine.Â The objective of this report is to provide an overview of various aspects of prevention of vibration hazards to workers following the entry into force of the vibration directive. It will show that vibration is increasingly important on account of the vibration directive, increasing exposure of women, ageing of exposed persons, and the development of new tools for prediction.Â Data on occupational exposure to vibration usually distinguishes between drivers of mobile machines, operators of hand-tools and people working in the vicinity of stationary machines.
