Environmental Science are so varied it is difficult to consider them as one category. knowledge of earths systems
to protect the environment and human health for natural resource management, and system evaluation and
monitoring These are just a few of the questions that geographers investigate.

A coupled human-environment system (known also as a coupled human and natural system, or CHANS) characterizes the dynamical two-way interactions between human systems (e.g., economic, social) and natural (e.g., hydrologic, atmospheric, biological, geological) systems. This coupling expresses the idea that the evolution of humans and environmental systems may no longer be treated as individual isolated systems. Human & Environmental Systems Major. B.S. Earth and Environmental Science Degree information. The Department of Earth & Environmental Systems offers a Bachelor of Science in Human and Environmental Systems with concentrations in anthropology, geography, and GIScience. Human and Environmental Systems Concentrations: Anthropology: This concentration focuses on the interrelationships of humans and the environment including human adaptation, the emergence of humans, and the influence of humans on the environment. Course work includes study in physical and cultural anthropology and archeology, human evolution, human ecology, and electives selected from areas such as prehistory and forensic anthropology. The teaching and research unit Human-Environment Relations (HER) deals with the issue of sustainable development in human-environment systems. Inter- and transdisciplinary methods have been developed to analyze these systems and their regulatory mechanisms, to model their evolution, and assess strategies for intervention. Our research areas are linked to land use and take into account the global impact of local sustainability efforts.

Economic geography examines relationships between human economic systems, states, and other factors, and the biophysical environment. Subfields include: Marketing geography and Transportation geography. Historical geography is the study of the human, physical, fictional, theoretical, and "real" geographies of the past. Historical geography studies a wide variety of issues and topics. A common theme is the study of the geographies of the past and how a place or region changes through time. Many historical geographers study geographical patterns through time, including how people have interacted with their environment, and created the cultural landscape. Politics[edit]. Human and Environmental Systems: A Geographer's Appraisal. Article. Oct 1979. As it seems, geographers have based their concept and understanding of the world on the assumption that it consists of diverse systems - this is revealed by the way they refer to the earth system, ecosystems, economic systems, social systems etc. as a matter of course. In consequence, modern systems theory might serve as a kind of background theory for an integrating approach of both geographies.
